Why did you change the heater? The heater should be the same, you just need something to control the heater to heat without ignition.

Which heater did you install? Was it an original Touareg heater, or a Webasto OEM?

hello,

I changed the original heater 7L6815071g with one functioning vehicle is stationary 7I9819008h.

008H This allows it to be activated with the can-bus vw, the compass module, and also by the receiver vw webasto (other than heater that sends a signal K-bus).

all this because the electronic control unit of 071g is not enabled for use with the can-bus signals for heating the vehicle is stationary.

Before changing the heater had a Webasto T91,

This activated the heater with remote control, but it was not possible to activate the compass module,

also the heater warmed always all the water of the cooling circuit.

the valve N279 was not present as standard.

soon.
